School of Computer Science

COMP-8547 Advanced Computing Concepts - Fall 2021
Final Project

<u>Deadlines:</u> **Presentation: Week#10 during class**
Upload source code/presentation: before midnight on the presentation day

Guidelines: This project will be submitted as a group of 3 or more students. However, group participants may be evaluated individually and may receive a different mark from the other group members.

Goals: The aim of the project is to apply the concepts learned in class in a real system such as a Web search engine. Students will obtain hands on experience in developing a real system using the data structures and algorithms studied and evaluating the system on the basis of the methods for analysis, and the use of Java 8 and Eclipse.

Description: The project involves developing a <mark>Web search engine</mark> that uses concepts from three to five different concepts learned in class. Projects can be developed either individually or as a group, although group work is encouraged. In case of group work, an individual mark will be assigned to each group member. Students are encouraged to propose their own ideas on which features the Web search engine will include. Some examples are: <u>finding patterns using regular expressions</u>, <u>translation of HTML to text</u>, <u>ranking web pages using sorting</u>, <u>heaps or other data structures</u>, <u>finding keywords using string matching</u>, <u>use of inverted index</u>, <u>analyzing frequencies using hash tables or search trees</u>, <u>using large dictionaries/datasets</u>, <u>sorting techniques</u>, <u>search trees</u>, <u>spellchecking keywords or HTML files</u>, and many others. Some ideas have been discussed in class, while some others are given in the assignments (as optional work). Note that a GUI for your search engine is not required, even though you would like to implement it.

Specific tasks to do:
1. Describe the system:
    - i   Describe all the features of your Web search engine.
    - ii   How you have implemented and used the concepts discussed in class in your system.
2. Prepare a short presentation (20 minutes in total; 15-22 slides). Record a video of this presentation.
3. All team members show present. Each person explains his/her contribution and work in this presentation. The presentation may also include a demonstration of the system.
4. Upload the presentation video and the source code (in Eclipse format) by the end of week 10. Marks will be deducted if the presentation file and source code are not uploaded by the due date.

Submission:

1. You must submit: (i) presentation video and (ii) all source files used in your project, ideally, in Eclipse format.
2. You should upload presentation video on Youtube and all source code files to a cloud place (e.g., Dropbox, Github, uwin365, etc.). The links to them should be uploaded to the Blackboard.
3. In order to obtain a mark, all students who participate in the project must submit both links of the presentation and source code to the Blackboard. In the presentation, include the name of participant along with his or her role
4. The presentation must provide a clear description of your project and the features, concepts used and the other items as requested. Marks will be deducted if explanations or descriptions are missing.
5. Any submission after the deadline will receive a penalty of 10% for the first 24 hrs, and so on, for up to three days. After three days, the mark will be *zero*.
6. Unlimited resubmissions are allowed. But keep in mind that we will consider the last submission. That means that if you resubmit after the deadline, a penalty will be applied, even if you submitted an earlier version in time.
